JaniCard

ID issuance in SAP® – Simple and professional

Wherever complexity increases, simplicity becomes the formula for success. This is especially true for corporate software. The use of integrated systems offers enormous potential here to reduce administration costs – and thus save valuable resources.

With JaniCard, we have developed such an integrated system. Companies and public authorities that manage their employee data via an HR system such as SAP can thus easily and quickly create and print ID cards for employees from the HR system.

A practical example

The problem: Island solutions

A mid-sized company runs its HR administration through SAP, but employee IDs continue to be generated and printed using an external system. Data must also be extracted from the SAP database and then re-imported using a separate interface — a laborious task when dealing with almost 1,000 employees. The problems are many and real:

■ Significant time and expense
■ Potential corruption of data due to redundant data storage
■ Additional training and roll-out costs

SAP is a registered trademark of SAP AG.

Professional card management

The solution: Integration

By introducing *JaniCard*, database redundancy was eliminated and the ID management process shifted to directly within SAP.

- Changes need be made only once and are then automatically stored in SAP
- Passport photos can be taken directly from SAP
- Business cards can also be created and printed via the system

Design freedom with CardDesigner

The cards can be individually designed with the so-called CardDesigner, e.g. in your corporate design. Different layout types are also possible so that, for example, employees in leading positions can be assigned special layouts.

For regular visitors: Administration of third-party contractors

Employees of external companies are just as easy to manage. Data is recorded directly in the system, and you can also enter an "expiry date" as required. A photo is also added to these ID cards via a connected digital camera.

Your advantages with JaniCard

- ID card creation from SAP HR, based on employee master records
- Simple data maintenance, automated updates during ID issuance
- Locking, "expiry date" and other security functions
- IDs for third-party vendors, also through SAP
- Integration of passport photos from the SAP archive
- Pictures can be recorded using a software-controlled digital camera, with storage and display of the image in SAP
- Business card management
- Flexible control with ID number
- Complete compliance with the SAP authorisation concept
- Logbook: Actions are logged together with user name
- Security: Integration into existing SAP authorisation concepts. Employee-related data is only stored on the company's own HR systems.
