

Janitor[®]

Access control directly in SAP[®]

... more convenient and secure than ever before.

Discover the new possibilities for access monitoring and control with SAP[®] and Janitor[®]

SAP[®] put your company's entire set of economic data at your fingertips. What's been missing until now was the ability to use that data for access control. Access terminals can only be linked to personnel data in SAP[®] via workarounds using external systems. Right now data is almost always recorded redundantly, and almost never in the most current state.

Janitor[®] delivers the **world's first SAP[®]-based program for access management**. It communicates with the terminals via a proprietary standard interface, ACS-PDC. For the first time, you can administer access credentials and analyse attendance and absence times without leaving the familiar software interface.

Janitor[®] also eliminates the need for redundant data. All processes undertaken at the terminals are immediately available in SAP[®] for processing and analysis. The reverse is also true: the terminals are always working with up-to-date personnel data.

Janitor® makes it easy

Users will appreciate how easy **Janitor®** is to operate, as it can directly access all time management data in SAP®. Reader devices can also be defined in SAP® – including assignment of IP addresses, cost centres, entrances/exits, etc. This saves the time otherwise needed to integrate third-party systems. And reduces your company's dependence on specialists.

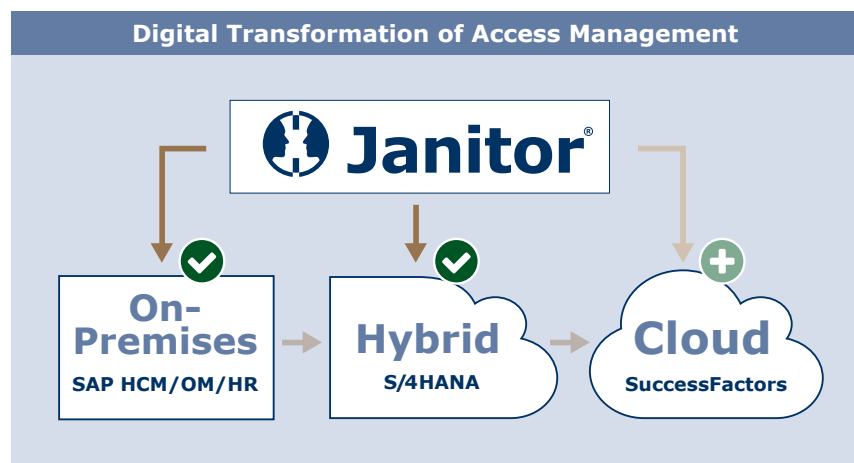

Where **Janitor®** really simplifies things is through the direct usage of the SAP® role concept: When personnel data is created in SAP®, **Janitor®** gets immediately to work in the background by assigning access rights. An employee assigned to the IT cost centre will thus receive access to the server room. If the employee is later transferred to a different cost centre, then the system will automatically modify those credentials.

It's also easy to assign credentials that deviate from the standard credentials associated with a cost centre profile: **Just a few clicks in Janitor®** are all that's needed to create a custom credentials profile.

Well equipped for the digital future

Cloud services, Internet of Things, Industry 4.0 – what steps have you taken, or are you planning on taking, to accommodate for the digital revolution? Whichever path you choose – **Janitor®** ensures that you're perfectly prepared for the digital age. Among the steps we've taken are an optional web management system with an alarm function. Janitor® is also available as Software as a Service (SaaS). That means that you can draw on its benefits even if using SAP® via a data centre.

Greater security for buildings and persons

Janitor® gives employees and third-party vendors access solely to the rooms and areas that you wish them to visit. Time profiles are used to ensure that this access is limited to specific time windows. For example, office workers may enter the building only between 7 am and 7 pm, while cleaning crews have access only in the early mornings and late evenings.

Logs are also created via SAP®. This makes it easier to detect not only when an employee is or isn't present, but also if they have a suspicious number of unauthorised access attempts. The program shows which terminals are operational and how many people are in which rooms — crucial information in the event of a fire alarm.

Overview of functions

- **Complete integration into SAP®**
including via SAP Organisation Management (OM)
- **Adoption of master records from SAP®**
 - Simple, centralised data storage
 - Derivation of access profiles from OM, works with plan variants
- **Seamless communication between SAP® and terminals**
Automatic Upload and download of all events
- **Individual access control** You define who may enter which areas and when
- **Access profiles define**
individual profiles, user groups
- **Analyse attendance and absence times**
Assess the recorded times in SAP®
- **ID generation and visitor management**
Visitor accounts can be created directly in SAP® by the entrance security staff
- **Security-related assessment functions**
Proof of unauthorised access attempts, overview of attendance in the event of alarms and additional
- **Functional controls**
Clear overview at all times of which terminals are operational

In brief

Janitor[®] combines the convenient and familiar interface of SAP[®] software with the powerful range of possibilities in a modern access management system. It provides comprehensive security for grounds, buildings and individual rooms and persons, without the disadvantages inherent to conventional third-party systems.

By the way: Our new program is named for the Roman god Janus, the keeper of doors and gateways. With his two faces, he had a constant view on both those coming and going and could see into both the past and the future. A deity of beginnings and success, which is why the first month of the year is named after him.
